

# Package ‘dualtrees’

October 28, 2019

**Title** Decimated and Undecimated 2D complex dual-tree wavelet transform

**Version** 0.0.1

**Description** What the package does (one paragraph).

**Depends** R (>= 3.5.0)

**License** What license is it under?

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 6.1.1

## R topics documented:

A\_b

*Bias correction matrices for the "b"-wavelets***Description**

Matrices supposedly needed in order to eliminate the effect of "spectral leakage" for the local dtcwt-spectra. Used by biascor( ... ).

**Usage**

A\_b

**Format**

A list with entries N512, N256, N128, N64, N32, each containing the bias correction matrix of appropriate size

**Source**

Calculated by hand via /user/s6sebusc/wavelets\_verification/general\_scripts/Amats\_cdtwt.r

**Examples**

```
image( A_b$N512 )
```

A\_b\_bp

*Bias correction matrices for the "b\_bp"-wavelets***Description**

Matrices supposedly needed in order to eliminate the effect of "spectral leakage" for the local dtcwt-spectra. Used by biascor( ... ).

**Usage**

A\_b\_bp

**Format**

A list with entries N512, N256, N128, N64, N32, each containing the bias correction matrix of appropriate size

**Source**

Calculated by hand via /user/s6sebusc/wavelets\_verification/general\_scripts/Amats\_cdtwt.r

**Examples**

```
image( A_b_bp$N512 )
```

---

biascor	<i>spectral bias correction, implemented in FORTRAN</i>
---------	---

---

**Description**

spectral bias correction, implemented in FORTRAN

**Usage**

biascor(en, a)

---

blossom	<i>Two meteorologists in front of cherry blossoms</i>
---------	---

---

**Description**

A very beautiful image.

**Usage**

blossom

**Format**

A 512x512 matrix of gray-scale values

**Source**

real life

**Examples**

```
image(blossom, col=gray.colors(32,0,1))
```

---

boys	<i>Two stromchasers in the sun</i>
------	------------------------------------

---

**Description**

Another classic image.

**Usage**

boys

**Format**

A 256x256 matrix of gray-scale values

**Source**

real life

**Examples**

```
image(boys, col=gray.colors(32,0,1))
```

---

c2q

*Transform six fields of complex coefficients back into four trees.*

---

**Description**

This function takes the the six directional complex daughter wavelet coefficients and re-constructs the three combinations of high- and low passes from the four trees (ab, ba, aa, bb).

**Usage**

```
c2q(comp)
```

**Arguments**

comp                      complex array of dimnesions nx, ny, 6

**Value**

a list of low- and high-pass components from the four trees, names LoaHia, LobHib, etc.

**Examples**

```
c2q( comp )
```

---

cen2uv

*transform angle and anisotropy into vector components for plotting*

---

**Description**

transform angle and anisotropy into vector components for plotting

**Usage**

```
cen2uv(cen)
```

---

decimate	<i>delete every second row of a matrix</i>
----------	--

---

**Description**

delete every second row of a matrix

**Usage**

```
decimate(mat, odd = FALSE, dec = TRUE)
```

---

dt2cen	<i>get the centre of the DT-spectrum</i>
--------	--

---

**Description**

get the centre of the DT-spectrum

**Usage**

```
dt2cen(pyr)
```

---

dtcwt	<i>The 2D forward dualtree complex wavelet transform</i>
-------	--

---

**Description**

This function performs the dualtree complex wavelet analysis, either with or without decimation

**Usage**

```
dtcwt(mat, fb1 = near_sym_b, fb2 = qshift_b, J = NULL, dec = TRUE,  
      mode = NULL, verbose = TRUE, boundaries = "periodic")
```

**Arguments**

mat	the real matrix we wish to transform
fb1	A list of analysis filter coefficients for the first level. Currently only near_sym_b and near_sym_b_bp are implemented
fb2	A list of analysis filter coefficients for all following levels. Currently only qshift_b and qshift_b_bp are implemented
J	number of levels for the decomposition. Defaults to $\log_2(\min(N_x, N_y))$ in the decimated case and $\log_2(\min(N_x, N_y)) - 3$ otherwise
dec	whether or not the decimated transform is desired
mode	how to perform the convolutions, either "direct" (default if dec=TRUE) or "FFT" (default if dec=FALSE)
verbose	if TRUE, the function tells you which level it is working on
boundaries	how to handle the internal boundary conditions of the convolutions, has no effect if mode="direct"

## Details

This is the 2D complex dualtree wavelet transform as described by Selesnick et al 2005. It consists of four discrete wavelet transform trees, generated from two filter banks a and b by applying one set of filters to the rows and the same to the other to the columns. In the decimated case (dec=TRUE), each convolution is followed by a downsampling, meaning that the size of the six coefficient fields is cut in half at each level. In this case, it is supposedly efficient to use direct convolutions (mode="direct"), the boundary conditions of which are steered by the boundaries-argument. If dec=FALSE, direct convolutions may be slow and you should use mode="FFT". In that case, you need to handle the boundary conditions externally (enter a nice  $2^N \times 2^M$  matrix) and the maximum level J is smaller than  $\log_2(N)$  due to the construction of the filters via an 'algorithm a trous'.

## Value

if dec=TRUE a list of complex coefficient fields, otherwise a complex  $J \times N_x \times N_y \times 6$  array.

## Note

Periodic and reflective boundaries are both implemented for the decimated case, but only the periodic boundaries are actually invertible at this point.

## Examples

```
dt <- dtcwt( boys )
par( mfrow=c(2,3), mar=rep(2,4) )
for( j in 1:6 ){
  image( boys, col=grey.colors(32,0,1) )
  contour( Mod( dt[[3]][ ,j ] )**2, add=TRUE, col="green" )
}
```

---

fld2dt

*transform a field, handle boundary conditions, return energy*

---

## Description

transform a field, handle boundary conditions, return energy

## Usage

```
fld2dt(fld, Nx = NULL, Ny = NULL, J = NULL, mode = NULL,
       correct = NULL, verbose = FALSE, boundary = "pad",
       fb1 = near_sym_b_bp, fb2 = qshift_b_bp)
```

---

get_en	<i>get energy from the dualtree transform</i>
--------	---

---

**Description**

get energy from the dualtree transform

**Usage**

```
get_en(pyr, correct = "fast")
```

---

holes	<i>insert holes into a filter?</i>
-------	------------------------------------

---

**Description**

insert holes into a filter?

**Usage**

```
holes(fil, second = TRUE)
```

---

idtcwt	<i>The 2D inverse dualtree complex wavelet transform</i>
--------	--

---

**Description**

Reconstructs an image from the pyramid of complex directional wavelet coefficients.

**Usage**

```
idtcwt(pyr, fb1 = near_sym_b, fb2 = qshift_b, verbose = TRUE,
        boundaries = "periodic")
```

**Arguments**

pyr	a list containing arrays of complex coefficients for each level of the decomposition, produced by dtcwt( ..., dec=TRUE ).
fb1	the filter bank for the first level
fb2	the filter bank for all following levels
verbose	if true, the function will say a few words while doing its thing.
boundaries	how to handle the boundary conditions, should be the same as for the decomposition.

## Details

This function re-arranges the six complex daughter coefficients back into the four trees, convolves them with the synthesis wavelets and adds everything up to recover an image. For the `near_sym_b` and `qshift_b` filter banks, this reconstruction should be basically perfect. In the case of the `b_bp` filters, non-negligible artifacts appear near  $\pm 45^\circ$  edges.

## Value

a real array of size  $2N \times 2M$  where `dim( pyr[[1]] ) = (M,N,6)` .

## Note

At present, only `boundaries="periodic"` actually works :(

---

make\_square

*Padded boundary conditions*

---

## Description

Padded boundary conditions

## Usage

```
make_square(picture, N, Ny = N, value = min(picture, na.rm = TRUE))
```

---

my_conv	<i>Column-convolutions</i>
---------	----------------------------

---

### Description

This function convolves the columns of a matrix `mat` with a filter `fil`.

### Usage

```
my_conv(mat, fil, dec = TRUE, mode = "direct", odd = FALSE,
        boundaries = "periodic")
```

### Arguments

<code>mat</code>	a matrix
<code>fil</code>	the filter to convolve the columns with
<code>dec</code>	if TRUE, every second row is discarded after the convolution
<code>mode</code>	how to actually do the convolutions, must be either "direct" or "FFT"
<code>odd</code>	if TRUE, the first row is discarded, otherwise the second row is.
<code>how</code>	to handle the boundaries, does nothing if mode="FFT"

### Details

This functions does all of the actual computations inside the wavelet transform. The direct mode uses `filter(...)` and can handle any field size you like. It is supposedly faster when the filters are short, i.e., in the decimated case. The FFT-version really only works when the input dimensions are whole powers of two and the filter is not longer than the columns of the matrix.

### Examples

```
dboysdy <- my_conv( boys, c(-1,1), dec=FALSE )
dboysdx <- t( my_conv( t(boys), c(-1,1), dec=FALSE ) )
par( mfrow=c(1,2) )
image( dboysdx, col=gray.colors(32) )
image( dboysdy, col=gray.colors(32) )
```

---

near_sym_b	<i>A q-shift filter for the second to last levels</i>
------------	---

---

### Description

Data from a QTL experiment on gravitropism in

### Usage

```
data(qshift_b)
```

### Format

A list of high- and low-pass filters for analysis and synthesis

**Source**

dtcwt python package

**Examples**

```
data(qshift_b)
```

---

```
near_sym_b_bp
```

*A q-shift filter for the second to last levels*

---

**Description**

Data from a QTL experiment on gravitropism in

**Usage**

```
data(qshift_b)
```

**Format**

A list of high- and low-pass filters for analysis and synthesis

**Source**

dtcwt python package

**Examples**

```
data(qshift_b)
```

---

```
period_bc
```

*Periodic boundary conditions*

---

**Description**

Periodic boundary conditions

**Usage**

```
period_bc(x, N, Ny = N)
```

---

```
put_in_mirror
```

*Reflective boundary conditions*

---

**Description**

Reflective boundary conditions

**Usage**

```
put_in_mirror(x, N, Ny = N)
```

---

q2c	<i>Transform data from the four trees to six fields of complex coefficients.</i>
-----	--

---

**Description**

This function takes the four combinations of high- and low passes from the four trees (ab, ba, aa, bb) and re-arranges them into the six directional complex daughter wavelets.

**Usage**

```
q2c(q)
```

**Arguments**

q                      a list of wavelet coefficients named LoaHia, LobHib, HiaLoa, ...

**Value**

a complex array of size nx, ny, 6

**Examples**

```
q2c( q )
```

---

qshift_b	<i>A q-shift filter for the second to last levels</i>
----------	---

---

**Description**

Data from a QTL experiment on gravitropism in

**Usage**

```
data(qshift_b)
```

**Format**

A list of high- and low-pass filters for analysis and synthesis

**Source**

dtcwt python package

**Examples**

```
data(qshift_b)
```

---

qshift_b_bp	<i>A q-shift filter for the second to last levels</i>
-------------	---

---

**Description**

Data from a QTL experiment on gravitropism in

**Usage**

```
data(qshift_b)
```

**Format**

A list of high- and low-pass filters for analysis and synthesis

**Source**

dtcwt python package

**Examples**

```
data(qshift_b)
```

---

shift1	<i>shift a matrix forward or backward by one row</i>
--------	--

---

**Description**

shift a matrix forward or backward by one row

**Usage**

```
shift1(x, forward = TRUE)
```

---

upsample	<i>add rows with zeroes to a matrix</i>
----------	---

---

**Description**

add rows with zeroes to a matrix

**Usage**

```
upsample(mat, odd = TRUE)
```
